Page 2 of 8

a nozzle positioned proximate the front end of said holder and defining a nozzle chamber therebetween, said nozzle defining a central bore for discharging a primary flow of gas from the nozzle chamber toward a workpiece located adjacent the nozzle, and further defining a plurality of secondary openings positioned across the nozzle chamber from the side openings at the front end of the holder for creating a secondary flow of gas therethrough.

- 32. (New) An electrode according to Claim 31, further comprising a valve assembly located in the internal bore of the upper tubular member, said ball valve assembly capable of regulating the gas through the electrode.
- 33. (New) An electrode according to Claim 31, wherein the side openings in said holder are arranged to impart a swirling motion to the gas exiting the side openings.
- 34. (New) An electrode according to Claim 31, wherein the plurality of side openings defined by the holder are located at a position less than 1/2 the length of the holder along the longitudinal axis from the front face of the holder.
- 35. (New) An electrode according to Claim 31, wherein the holder includes a threaded portion for threadably securing the holder to the upper tubular member.
